

Contents

1	Introduction	1
2	Previous Research and Scientific Background	3
2.1	Modified Illumination Techniques	5
2.1.1	Spatial Coherence	5
2.1.2	Off-axis Illumination	6
2.2	Phase Shifting Techniques	8
2.2.1	Phase Shifting Techniques Using Phase Shifting Masks	8
2.2.2	Phase Shifting Method Without Phase Shifting Mask - Interferometric Phase Shifting Technique	10
2.3	Filtering Methods	10
2.3.1	Image Formation Based on Fourier Optics	10
2.3.2	Pupil-Plane Filtering Techniques	11
2.3.3	Annular Illumination	13
2.3.4	Coated Objective	14
2.4	Nondiffracting Beams	16
3	Objectives	18
4	Scientific Results and Interpretation	20
4.1	Interferometric Phase Shifting Technique combined with off-axis illumination	20
4.1.1	Theoretical Results	20
4.1.2	Experimental Results	22
4.2	Annular Illumination – An Experimental Demonstration	26
4.2.1	Experimental Results	26
4.3	Coated Objective	28
4.3.1	Wave Optics Model	28

4.3.2	Simulation using Solid-C	29
4.4	Double exposure by means of a birefringent plate	33
4.4.1	Geometrical Optics Model	33
4.5	Coherent Multiple Imaging Technique by means of a Fabry-Perot Interferometer	37
4.5.1	Principles of the Fabry-Perot based CMI Approach	37
4.5.2	Simulation of a Fabry-Perot Interferometer by means of a Pupil-Plane Filter – Evaluation of the Point-Spread Function of the Optical System	39
4.5.3	Experimental results regarding an on-axis point-like source	45
4.5.4	Simulation result on an on-axis contact hole	50
4.5.5	Interaction between two holes	52
4.5.6	Preliminary studies for evaluation of extended periodical patterns	55
4.5.7	Evaluation of extended patterns	60
5	Conclusion	72
6	Magyar Nyelvű Összefoglaló	75
